I hold a degree in Software Development and have over three years of hands-on experience in the field. I've supplemented my formal education with design courses in tools like Figma and Adobe XD, as well as programming courses in JavaScript, React, and web layout. This has allowed me to sharpen both my technical skills and my practical approach to building digital solutions.

PROFESSIONAL EXPERIENCE

Instituto Ismac

Tumbaco, Ecuador

Full-Stack Developer

August 2022 – Present

- Built the institution's website from scratch, covering requirements analysis, responsive design and layout, feature implementation, and production deployment. Handled domain management, SEO optimization, and ongoing site maintenance.
- Contributed to the development of modules for the institution's Academic Management System (AMS), working on both the backend and frontend. A key contribution was building an interactive dashboard view with charts in React, integrated into an existing PHP (CodeIgniter) codebase — modernizing the interface and improving data visualization for users.
- Automated the student ID generation process within the AMS. Previously, each ID was created manually in a Word template, taking 3–6 minutes per student — during enrollment periods with over 100 students, that meant at least 8 hours of operational work. Developed a feature that generates and downloads the ID as a PDF with a single click, cutting issuance time by over 80% and eliminating manual data entry errors.
- Redesigned the AMS user interfaces, delivering a full visual and usability overhaul of the login screen and main dashboard. Optimized structure, styles, and responsive design, resulting in a more modern and intuitive interface aligned with the institution's needs.
- Built a custom chatbot for the institution's website from scratch, tailored to its specific requirements. Designed a scalable architecture that supports future AI integrations, enabling automated responses and improving the overall user experience.
- Developed and deployed a web platform for tracking institutional soccer championships. The platform showed upcoming match dates, standings, scores, registered teams, and a weekly-updated photo gallery. At the end of each tournament, winners in the men's and women's categories were published, centralizing information and improving communication with the school community.
- Provided general technical support to users, including credential management (password resets and platform access), system configuration, and basic hardware assistance, ensuring operational continuity and timely resolution of incidents.

- Developed a portfolio-style web app for a client focused on publishing multimedia content (videos, photos, and visual material). A standout feature was a custom macOS-inspired interface with interactive transitions, dynamic background changes, and “desktop”-style navigation, delivering a distinctive modern design.
- Built a corporate website for a software studio, creating a landing page from scratch aligned with the company’s brand guidelines. Implemented animations and transitions to enhance the visual experience, along with a functional contact form that automatically routes inquiries to the corporate email, streamlining communication with potential clients.
- Developed and deployed a certification system for a school in Pifo, designed to automate end-of-year diploma generation. Teachers enter information through simple forms, and the platform produces standardized certificates quickly, with no external design tools required.

Full-Stack Development*Ongoing Projects*

- Building MoonVideo, a scalable SaaS web platform focused on customizing and enhancing video players. It lets brands embed custom players into CMS platforms like WordPress and Wix, or any website via embeddable code. The goal is to give brands a video player that matches their visual identity without requiring any code changes. Currently in development.
- Currently building the frontend of a cross-platform academic system (web and mobile) aimed at students, with an interactive approach that enhances the user experience. The app lets students check grades, track academic progress, receive real-time notifications, manage their profile, and handle processes like internships, language certifications, and graduation requirements. It also includes light/dark theme support and dynamic visual elements such as animations and 3D components to boost engagement. Built with React, BEM-methodology CSS, Motion, Three.js, and react-parallax-tilt on the frontend, and Node.js with Express on the backend.
- Automated an institutional website by implementing a PHP backend that handles incoming emails directed to Human Resources, along with file uploads so applicants can attach their résumés. The system was fully developed, tested, and successfully deployed to production.

EDUCATION

Instituto Ismac

Software Development Technologist

English A2

Business Technology Tools Workshop (Git, GitHub, Power BI)

Tumbaco, Ecuador

July 2020 – July 2022

ADDITIONAL SKILLS

- **Frontend Development:** HTML, CSS, JavaScript, TypeScript, React, Vite, Tailwind, Bootstrap
- **Backend Development:** Node.js, Express, NestJS, PHP
- **Databases:** MySQL, PostgreSQL
- **Tools & Version Control:** Git, GitHub
- **Design & Prototyping:** Figma, Photoshop
- **DevOps / Infrastructure:** VPS management and application deployment to production
- **AI:** Proficient use of Claude Code
